

Energia Arena

Energia Arena meets the requirements for international competitions, but it also offers multiple training opportunities.

Energia Arena meets the requirements for international competitions, but it also offers multiple training opportunities. In addition, the construction of the arena served as a pilot project for control procedures of structural safety.

The pilot project was conducted by the Finnish Ministry of the Environment, with a focus on recognising the critical issues in construction.

The complex steel frame of the building is the result of Ruukki's efforts. The exterior walls are made of Ruukki's sandwich panels.
