

Jēkabpils Bus Station Building

During the implementation of the construction project, the main facade of the building was renovated. In the course of the reconstruction, the visual appearance of the facade was changed using the Ruukki Emotion facade cladding system. This complex solution includes the installation of a support structure, LED lighting, and the mounting of patinated Liberta Cor-Ten 700 facade cladding panels. The perforation pattern of the cladding panels is based on the motif of water flow and waves, with varying intensities of perforation. During the dark hours of the day, the background lighting of the facade highlights and enhances the perforation pattern, adding an additional dimension to the facade.
