

Sports centre – Mariahallen

“It’s at its most impressive in the evening, when the lights are lit behind the steel rainscreen panels and the turquoise of the panels shines behind the perforated steel panels. During the day, the panel patterns create different looks depending from where you view the building.

Mariahallen, a new sports centre in the Swedish city of Helsingborg has a hall for ball games and a gymnastics hall. On the second floor there are youth facilities for the arrangement of events and gatherings. The building project was ordered by the City of Helsingborg, whose criterion for the sports centre was that it was not to be a boring box.

Ruukki delivered the **energy panels** and cladding for the walls.

“It’s at its most impressive in the evening, when the lights are lit behind the steel rainscreen panels and the turquoise of the panels shines behind the perforated steel panels. During the day, the panel patterns create different looks depending from where you view the building.

“We chose Ruukki since they were able to provide both the panels and the **rainscreen panels**, which made our job easier. Ruukki even provided us with a detailed plan on how to install the panels,” says architect Henrik Troedson.
