The surrounding area is dominated by red-brick buildings, built over 100 years ago as a military campus. As the site is located on the Tammsaare Road, a major motorway, the architect wanted the building to represent both the historical context and the future of the area as a landmark.

It took a long time for the customer to find a suitable façade design and its choice of materials. Having previous experience with Ruukki Cor-Ten® cladding materials, choice was to use a material that was well known.

The Cor-Ten® steel adds a changing tonality and character to this building. The joints between the lamellas also add depth to the façade.

The collaboration between the architect and the customer during the project was excellent. We were proud to be part of this project.
