

Salmisaarenaukio Office Complex

Ruukki supplied the project with the steel frame as a material delivery, as well as façade and glass structures as a product parts deal.

The Salmisaarenaukio first office complex, completed in 2007, marked the beginning of construction work in the coal storage area of a former power plant. Accomplishing the architectural appearance of the project proved technically challenging.

The manifold façade structure necessitated more creativity and know-how for the structural design and implementation work in comparison with a traditionally linear building.

Ruukki supplied the project with the steel frame as a material delivery, as well as façade and glass structures as a product parts deal. Factory-prefabricated structures were utilised in the project to the largest possible extent.
